

# CHIP Evidence to field-inspection priorities

## 01 OBSERVATIONS

### Landsat landscape record

55 scenes | five epochs  
30 m common endpoint mask

### Terrain and components

Elevation and D8 drainage  
17 mapped components

### Regional weather

Daily records, 1991–2025  
Four native reanalysis cells

## 02 ANALYSIS

### Landscape pressure L

Oriented NDVI, NDBI, MNDWI  
Correlated terms grouped

### Terrain susceptibility T

Slope, wetness and proximity  
250 / 500 / 1,000 m support

### Climate context

Trends and acquisition lags  
Cross-product comparison

## 03 INTERPRETATION

### Relative priority

$$P = 0.5 L + 0.5 T$$

Sensitivity-aware tiers  
Targeted inspection questions

### Separate proxy benchmark

WorldCover-derived labels  
Buffered spatial model selection  
Agreement and calibration  
No condition-validation link

Climate informs interpretation; it does not create 30 m weather detail.

## ROBUSTNESS

Scale • weights • ablation • spatial resampling • positional sensitivity

Decision boundary: screening of landscape context, not observed damage or deterioration probability.
